

Supplementary Table 1

Paired comparison of local largest Lyapunov exponent (LLE) during stimulation vs. no-stimulation periods across adaptation conditions.

Condition	Networks	Wilcoxon p	Cohen's d	Median Δ LLE	Mean Stim LLE	Mean No-Stim LLE
No Adaptation	25	0.035*	0.41	0.46	0.52	0.25
SFA Only	25	0.001*	0.80	0.38	0.41	0.14
STD Only	25	0.313	-0.21	-0.08	-0.13	0.00
SFA + STD	25	0.476	-0.25	0.04	-0.02	0.03

Note. $N = 300$ neurons per network, connection density = 33%, $f \in [0.40, 0.60]$. Wilcoxon signed-rank test (two-tailed) compared mean local LLE during stimulation versus no-stimulation periods. Δ LLE = LLE_{stim} - LLE_{no-stim}.

* $p < .05$.
